Interviews - integral text (English)	10
Interviewee: I 1	10
Interviewee: I 2	26
Interviewee: I 3	40
Interviewee: I 4	55
Interviewee: I 5	70
Interviewee: I 6	86
Interviewee: I 7	101

Scoring

The interview notes were reviewed to identify quantitative scores applying following criteria (in this ordered):

- *C1 (score available)*: When a clear and unique self-declared score was provided, this was used as a score. In case the interviewee provided two scores (e.g.: 4 or 5), it was used the average (4.5). For those answers were alternative were provided for gear/target, create separate scoring.
- *C2 (score to be interpreted)*: Answers that were providing meaningful text but not a clear number, or that were considered worth of further attention, were scored as 999.
- *C3 (does not apply)*: Answers that were missing because the event/condition does not apply were scored as -999. When the “does not apply” was identified in more than 50% of the answers, the combination of fishing style-event was excluded from further analysis.
- *C4 (can't answer)*: Answers that were missing because people did not have a personal experience to refer but refers to an event that is relevant (i.e.: if during a storm you never go out, you might don't know about how catchability changes) were scored as -998.
- *C5 (garbled)*: Answers that were not coherent with the question were scored -997

Table A.1: coding system used to categorise answers according to their interpretation

Score	Type	Description
x	C 1	Number (x) available
999	C 2	To be interpreted
-999	C 3	Does not apply
-998	C 4	Cant answer
-997	C 5	Garbled

The questionnaires originated more than 500 scores. About half of the responses (266) were including a clear and unequivocal quantitative score. A large number (123) were not considered relevant by interviewee. Answers that were considered relevant but did not provide a clear score were 150, among which the large majority (105) contained enough information to attempt an interpretation.

Table A.2: number of answers by interpretation category

Score	Frequency
x	274
-999	118
999	102
-998	38
-997	4

Interpretation

A structured coding approach was applied to those answers scored as 999 using both human expertise and artificial intelligence assistance.

- Text for unclear answers was revised to extract the main keywords (i.e.: most people say; I think it does not affect so much etc.), and to identify whether the answer was needed to support narrative or to provide quantitative information.
- The keywords were pooled based on the expected type of answer (e.g.:). Three researchers independently assigned quantitative scores to textual descriptions based on predefined LIKERT scale. These expert based ratings were averaged to create a consensus dataset, which was used to establish interpretive patterns linking descriptive terms to quantitative values.
- Answers without keywords needed for quantitative information were reviewed with Artificial Intelligence. We employed OpenAI’s GPT-5 (ChatGPT, September 2025 version) as an assistant to generalize these patterns to new responses. The model was not trained on external data but was guided by the team’s own scoring framework. For each new description, the model produced a suggested numerical score along with a written rationale. All outputs were reviewed and validated by the researchers to ensure consistency with the established coding scheme
- Answers without keywords that were needed to support narrative (i.e.: management) were left unscored.

Expert scoring

Expert scoring of keywords produced the following results, which were used to assign scores to 87 answers:

Table A.3: scores assigned by experts to answers not providing an explicit scoring

question	coding	answer	Exp1	Exp2	Exp3	mean	sd
is it possible [to avoid something]	1-5; from 1 – very difficult, to 5 – very easy	hard	2	2	2	2	0.0

AI scoring

This option was applied to a limited number of responses.

Q1

Question: How much do you think they vary among the group of people you represent? Possible answers: 1–5; from 1 – not at all, to 5 – very much

Observed Answer: it is so personal, some do not care at all, they just drink beer all day; we discuss things like this all the time, most are probably quite stressed by such situations

Score: 4

Why: The reply indicates clear heterogeneity — a minority who “do not care at all” vs a majority who are “quite stressed.” That is meaningful variation but phrased so that most are similar (stressed) with a minority different. In your training examples, minority exceptions vs majority agreement tended to map to a high-but-not-maximum value. Confidence: medium–high.

Q2

Question: How much do you think they vary among the group of people you represent? Possible answers: 1–5; from 1 – not at all, to 5 – very much

Observed Answer: There are some who have rights but don’t practice at all, and then some who practice like I do, just now and then. Then there are those who have leased out their permits, and in those cases, there is somebody who practices quite intensively

Score: 5

Why: The answer describes the full spectrum (no practice → occasional → very intensive). That explicit broad distribution matches your examples that consistently received top-end variability scores. Confidence: high. Q2 Question: How likely is it that you explore new techniques or strategies? Possible answers: [1–5; from 1 – very unlikely, to 5 – very likely] *Observed Answer:* Would probably try to find solutions; activity would certainly change, and then people would follow that change; there is probably some variation among people depending on what one is specialized in *Score:* 4 *Why:* The speaker says they “would probably try” and expects change and follow-up by others — language that in your dataset equates to a positive likelihood but not the absolute “definitely” (which you typically scored a 5). The note about variation reduces absolute certainty slightly. Confidence: medium–high.

Q3

Question: If your income from activity A decreases, can you complement or replace it? Possible answers: [1–5; from 1 – very unlikely, to 5 – very likely]

Observed Answer: It would be very hard to replace activity A it with other income. Most have other jobs in winter, but A is such a significant part of income

Score: 1

Why: The phrase “very hard to replace” and “A is such a significant part” matches wording in your dataset that mapped to the low end (very unlikely) — even though there are seasonal other jobs, the respondent explicitly indicates replacement is essentially not feasible. Confidence: high.

Q4

Question: How easy is it to avoid an extreme weather event by going to another location?

Possible answers: [1–5; from 1 – very difficult to avoid, to 5 – very easy to avoid] *Observed Answer:* I Stop my activity *Score:* 1 *Why:* The respondent says they stop the activity instead of relocating to avoid the event — that implies relocation is not used/feasible. In your training set, answers that indicate “we don’t/stop” were scored at the difficult end (1). Confidence: medium — short reply is slightly ambiguous about whether “stop” means temporarily pause or that relocation is impossible, but both interpretations point to very low ease of avoiding by moving.

Q5 *Question:* If the following type of extreme event occurs, how likely is it that you go out and do the activity? Possible answers: [1–5; from 1 – very unlikely, to 5 – very likely] *Observed Answer:* we wait because the product can spoil *Score:* 1 *Why:* “We wait” because of spoilage risk indicates they do not go out during the event — i.e., very unlikely. In your dataset, similar phrasing (“we wait / won’t go because...”) mapped to the lowest likelihood. *Confidence:* high.

999	C 2	To be interpreted
-999	C 3	Does not apply
-998	C 4	Cant answer
-997	C 5	Garbled

Interviewee: I 1

focused on the waters around stockholm, both in the archipelago and in lakes. he guides mainly for trout, pike, and perch, and makes a living from his business. on average, they guide about 100 days per year. the guiding business is seasonal and follows the fish's behaviour, activity, and migrations. they fish in lakes, streams and coastal areas. they can use boats in coastal areas and lakes. it is more common in spring and summer. in winter they guide ice fishing. if there is no ice they can switch to spinning but this is unpredictable. the most fished species are sea trout, salmon, pike, and perch. they primarily practice catch and release fishing. because fishing guide is mostly a touristic activity, it is more active in the weekend, and their flexibility is linked to customers flexibility. how they adapt: fishing guide adapts all the time according to the conditions and the clients need. they are flexible for place, species and gear, but its ability to adapt to conditions depends on client's flexibility. he notices a decline in demand during extreme hot weather, and for security reason he cannot guide if he feels danger. in winter he can replace ice fishing with spinning but cannot book this in advance. in summer he can choose between different options depending on the conditions. he can change fish location and target (and accordingly gear) in heatwaves, algal bloom and stormy conditions. in hw he can move the trips to mornings and evenings. in hw and ab he moves from shallow waters for pike to below the thermocline for sea trout; in stormy conditions he goes the other way around.

Q 2 - go_fishing

If the following type of extreme event occurs, how likely is it that you go out and fish?

[1-5; from 1 – very unlikely, to 5 – very likely]

Table A.2: Interviewee: I 1 Q 2

	Event	Answer	Score	Method
a	Heatwave in the winter season	Very different, depends on what is booked. Sometimes ice fishing is booked and then we have to cancel all bookings, sometimes open water fishing is possible. Lose ice fishing customers and gain spin fishing ones; 1 ice fishing (spin fishing customers can't be booked in advance in winter, you can't count on a heatwave in winter)	NA	M
b	Heatwave in the summer season	4. Some fishing is closed if it gets too hot, e.g., river fishing. It's difficult to fish if it gets extremely hot, but I try to adapt; so far I haven't canceled coastal fishing, I move it to mornings & evenings. But, for example, Nyköpingsån was closed because the water was too warm. Also depends on how hot it is. It happened in 2018, depends on what happens with our fish	4	O

c	Severe icing (in the winter season)	1. Haven't experienced severe icing, only seen it on YouTube; don't know if it happens on sportfishing boats; it has to be safe, not dangerous; if it's icing like on the Great Lakes, then the boat breaks	1	O
d	Algal bloom (in the summer season)	1. Usually happens offshore; can't handle it if I have a trip, e.g., from Sandhamn, but then we can go inland when there's algal bloom	1	O
e	Extreme cloudburst (in the summer season)	1, dangerous	1	O
f	Gale	5Gale is normal (sometimes we cancel), from strong gale and upwards we stay home (18 19 m/s average and 25 m/s in gusts is not possible)	5	O
g	Storm	1	1	O
h	Are there any of these in combination that affect how likely it is that you go out and fish?	A lot is about safety, combinations become dangerous, e.g., strong icing and strong winds, I avoid this as much as possible; would also get fewer requests, since fishing should be enjoyable	NA	NA

Multiple options identified

Table A.3: Interviewee: I 1 Q 2

	Event	gear	Score (given)
a	Heatwave in the winter season	ice fishing	1
a	Heatwave in the winter season	rod	5

Q 3 - catchability

Do you experience that the catchability of the fish changes due to such extreme weather events?

[1-5; from 1 – much worse, 3 – no difference, to 5 – much better]

Table A.4: Interviewee: I 1 Q 3

	Event	Answer	Score	Method
a	Heatwave in the winter season	1 ice fishing, there is no catchability if there are no fish; however, the fish like when it gets warmer, so if it's spin fishing then 5	NA	M
b	Heatwave in the summer season	2	2	O
c	Severe icing (in the winter season)	No, can't conduct fishing; if it is possible to fish then it becomes 2.	2	O
d	Algal bloom (in the summer season)	2, the fish move from that area; also becomes difficult fishing (fished during an algal bloom this summer, had to go all the way into the bay because where we intended to fish we only got weeds on the hook).	2	O

e	Extreme cloudburst (in the summer season)	Don't go out in cloudbursts; fish react to pressure changes; if there is low pressure during a downpour, then they stop biting, but if it rises after the downpour then it can be good; so I can't say	-998	NA
f	Gale	: 2, a gale doesn't matter for the fishing itself, other than that the gear is hard to use	2	O
g	Storm	Don't go out in a storm	-998	NA

Multiple options identified

Table A.5: Interviewee: I 1 Q 3

	Event	gear	Score (given)
a	Heatwave in the winter season	ice fishing	1
a	Heatwave in the winter season	rod	5

Q 4 - catch_assemblage

Do you catch a different composition of species during such extreme weather events?

[1-5; from 1 – very similar, to 5 – very different species composition]

Table A.6: Interviewee: I 1 Q 4

	Event	Answer	Score	Method
a	Heatwave in the winter season	: 5 sea trout on open water, instead of perch and pike under the ice	-997	G
b	Heatwave in the summer season	: 5 redirect the fishing down below the thermocline	-997	G
c	Severe icing (in the winter season)	No information	-998	NA
d	Algal bloom (in the summer season)	More about changing location (deeper), 5 choose other species (we fish pike & perch, sea trout)	-997	G
e	Extreme cloudburst (in the summer season)	No other species, more that we don't fish	-998	NA
f	Gale	: 2 sometimes; if it blows too hard and we are supposed to fish trout, then sometimes we have to go in and fish perch & pike instead	2	O
g	Storm	Cancel	-998	NA

Q 5 - catch_condition

Are the fish in the catch of worse condition or quality when caught during extreme weather events, compared to under normal weather conditions?

[1-5; from 1 – much worse, 3 – no difference, to 5 – much better quality]

Table A.7: Interviewee: I 1 Q 5

	Event	Answer	Score	Method
a	Heatwave in the winter season	3	3	O
b	Heatwave in the summer season	2, a b it worse	2	O
c	Severe icing (in the winter season)	3	3	O
d	Algal bloom (in the summer season)	2	2	O
e	Extreme cloudburst (in the summer season)	3	3	O
f	Gale	3	3	O
g	Storm	3	3	O

Q 6 - cope_condition

If the condition/quality of the fish in the catch is negatively affected, how likely is it that you can do something about it? Explain what!

[1–5; from 1 – very unlikely, to 5 – very likely]

We release 98% of the fish; we are more concerned with the survival of the fish, e.g., during a heatwave survival becomes difficult; we don't want to fish pike when it's 30 degrees, then we'd rather fish sea trout that can survive better when we release it, since it goes down to colder depth

Table A.8: Interviewee: I 1 Q 6

	Event	Answer	Score	Method
a	Heatwave in the winter season	NA	-999	NA

e	Extreme cloudburst (in the summer season)	NA	-999	NA
f	Gale	NA	-999	NA
g	Storm	NA	-999	NA

Q 7 - lag_effect

Do this extreme weather events have long-term effects on how you fish or catch composition

4. Yes, I do have to change the setup of the fishing. With milder winters, I can't fish or might even take a regular job

Table A.9: Interviewee: I 1 Q 7

	Event	Answer	Score	Method
a	Heatwave in the winter season	NA	4	NA
b	Heatwave in the summer season	NA	-999	NA
c	Severe icing (in the winter season)	NA	-999	NA
d	Algal bloom (in the summer season)	NA	-999	NA
e	Extreme cloudburst (in the summer season)	NA	-999	NA
f	Gale	NA	-999	NA
g	Storm	NA	-999	NA

Q 8 - unc_2_7

How much do you think the answers to these questions (questions 2–7) vary between fishers in the group you represent? 1–5; from 1 – not at all, to 5 – very much

Table A.10: Interviewee: I 1 Q 8

Answer	Score	Method
5, since I am chairman I have the mandate to represent the others	1.5	NA

Q 9 - personal_safety

How much concern for your personal safety do these extreme weather events bring?

[0–2; 0 – no concern, 1 – personal injuries, 2 – life-threatening

Table A.11: Interviewee: I 1 Q 9

	Event	Answer	Score	Method
a	Heatwave in the winter season	1 I do it for ice fishing; if no one falls in now, it is a miracle	NA	NA

b	Heatwave in the summer season	0	0	O
c	Severe icing (in the winter season)	2	2	O
d	Algal bloom (in the summer season)	0	0	O
e	Extreme cloudburst (in the summer season)	1	1	O
f	Gale	1 (ordinary gale none, but strong gale)	1	O
g	Storm	2	2	O

Multiple options identified

Q 14 - unc_9_13

How much do you think the answers to these questions (questions 9–13) vary between fishers in the group you represent?

Table A.17: Interviewee: I 1 Q 14

Answer	Score	Method
great similarity between boat guides (1)	1	NA

Q 15 - avoidance

How easy is it to avoid an extreme weather event by going to another fishing location?

[1–5; from 1 – very difficult to avoid, to 5 – very easy to avoid]

Easy for me to switch but ask what the customers want (e.g., Americans who are booked for ice fishing). Large differences from the normal are a problem, with bookings we do not know what we shall book (e.g., closed Nyköpingsån fishing due to heatwave). The customers also have to be flexible. 2 for those that are not dangerous; 1 for what is dangerous (cannot conduct activities)

Table A.18: Interviewee: I 1 Q 15

	Event	Answer	Score	Method

d	Algal bloom (in the summer season)	NA	2	NA
e	Extreme cloudburst (in the summer season)	NA	1	NA
f	Gale	NA	1	NA
g	Storm	NA	1	NA

Q 16 - gear characteristics

Do you have gear, equipment and boat that allow you to choose other fishing locations (to avoid an extreme weather event)?

[0–2; 0 – no, requires that I am at the same place, 1 – yes, within short distances, 2 – yes, also at long distances]

Table A.19: Interviewee: I 1 Q 16

Answer	Score	Method
--------	-------	--------

0 , if you take the extreme weather event to its peak, extreme cloudburst or storm, then the boat does not help; same if it is extreme heatwave, then we cannot go out 38 42 °C; in 2018 we could not book the fishing. Another parameter: our activity also depends on demand, and demand is made impossible during many of these extreme weather events

0 O

Q 17 - infrastructure

Is there infrastructure on land (e.g., landing harbors, boat ramps) that makes it possible to choose other fishing locations?

[0–2; 0 – no, requires that I am at the same place, 1 – yes, to some extent, 2 – yes, much that makes great mobility possible]

Table A.20: Interviewee: I 1 Q 17

Answer	Score	Method
2	2	O

Q 18 - management__space

Do current management regulations make it possible to choose other fishing locations? Briefly describe what possibly limits your choice.

[0–2; 0 – no, requires that I am at the same place, 1 – yes, to some extent, 2 – yes, much that makes great mobility possible]

Table A.21: Interviewee: I 1 Q 18

Answer	Score	Method
Sport fishing has great mobility; the accessibility to water. 2.	2	O

Q 19 - management__species

Do current management regulations make it possible to choose other target species? Briefly describe what possibly limits your choice.

[0–2; 0 – no, requires that I am at the same place, 1 – yes, to some extent, 2 – yes, much that makes great mobility possible]

Answer	Score - low (given)	Score - up (given)	Unit
maybe 1000 SEK/fishing day; this is the biggest expense besides food for a day	1000	1000	sek_day

Q 40 - extra_fuel

What are the costs for extra fuel to travel further than normal?

[free text description]

Table A.43: Interviewee: I 1 Q 40

Answer	Score - low (given)	Score - up (given)	Unit
1500 SEK for such a longer travel day	500	500	sek_day

Q 41 - extra_crew

What are the costs for extra crew on board?

[free text description]

Table A.44: Interviewee: I 1 Q 41

Answer	Score - low (given)	Score - up (given)	Unit
I always guide myself; there are some who sometimes take in an extra person; quite expensive, since it is salary and employer's contributions etc. (guess they get 1500 SEK, so in total it becomes 3000 SEK).	2000	3000	sek_day

Q 42 - extra_cleaning_cost

What are the costs for gear cleaning (in case of unusual fouling, e.g., due to algal bloom)?

[free text description]

Table A.45: Interviewee: I 1 Q 42

Answer	Score - low (given)	Score - up (given)	Unit
a whole workday for service, so it costs what I earn on a fishing day; no, not for algal bloom, but in gale or storm there are many lines that must be fixed; twice I have broken the boat due to icing, the trim motor and the steering, 15,000 SEK per time.	NA	NA	sek_day

Q 43 - extra_other

Are there any other extra costs that may arise during extreme weather events, and how large are they then?

[free text description]

Table A.46: Interviewee: I 1 Q 43

Answer	Score - low (given)	Score - up (given)	Unit
the biggest cost is the loss of income. Cancelled fishing days. A tourist usually does not rebook, especially if it is short notice change then I don't have time to get in something else. Guides for corporate events are at 30,000 SEK, or 60,000 SEK when we are out with 6 boats; if you miss that then the whole income disappears; loss of income also arises because people do not book when there is extreme weather.	NA	NA	sek_day

Q 44 - unc_36_42

How much do you think the answers to these questions (questions 36–43) vary between fishers in the group you represent?

Table A.47: Interviewee: I 1 Q 44

Answer	Score	Method
significant variation; 5.	5	NA

Q 45 - addition

Anything you want to add?

[free text description]

Table A.48: Interviewee: I 1 Q 45

Answer	Score	Method
There may be disease among the fish during heatwaves, and that can have consequences for fishing for five years ahead; and algal bloom we do not know, but it does not feel good. We are completely dependent on the fish being well. How have perch and pike been doing this summer? It was a bit weak when it was hot, but now they have started again. Probably quite a normal year. One adapts to the new. Sour that one cannot fish in the outer archipelago. It is an enormous difference from how it was when I was little, we would need supportive stocking of the pike stocks. First year with protection. I have not seen so much herring in 15 years! We have had incredibly little fish coming in to spawn earlier; when they last did test fishing at Mörkö, there was an 84 86% decline in spawning herring. Out last week, then there was herring in Furusundsleden, a lot of herring, proper schools. Summer herring. Don't know when I last saw that. Very positive! Will have great impact on the predatory fish stocks. Hope that the seals can move out again, so they don't have to hang around	t Slus	en. -9

Q 46 - substitution_capacity

If I lose one planned fishing day, I can usually make up for it later without it affecting what I achieve overall

[1-5; from 1 – strongly disagree, to 5 – strongly agree]

Table A.49: Interviewee: I 1 Q 46

Answer	Score	Method
The income is gone for that day. You lose customers. Even if you reschedule the fishing day, you lose a new customer on the rescheduled day.	1	O

Q 47 - unc_46

How much do you think the answers to these questions (question 46) vary between fishers in the group you represent?

Table A.50: Interviewee: I 1 Q 47

Answer	Score	Method
--------	-------	--------

The variation is small between those who guide full-time, everyone would probably agree. If you guide part-time, a lost fishing day doesn't matter that much. So some variation.

Interviewee: I 2

Operates in the north of bothnian bay (kalix). They fish in coastal waters with gillnets and traps (salmon traps and other traps for perch and bream), and they operate from boat at very short distances from their harbour. The target they mention is perch, bream, herring, salmon. They also run vendace fishery for roe production. The main fishing season is summer (from april to august). In winter they generally do not go out until spring comes. they can do sporadically some ice fishing. How they adapt: structured succession of fishing styles within season. depending on the moment, they want to aim for something and may be forced to change. in the case they are fishing with nets (for pike, perch and herring?) they are flexible. their options to avoid hw and ab are to fish deeper, to avoid storms is to choose a different bay. hw especially affects perch, which die immediately. they notice more breams with hw. salmon traps are very rigidly managed and tied to a unique boat. salmon traps do not suffer from hw, but they do of storm, so if they must haul them up with a bigger boat, they get a penalty. vendace season is also rigid and short.

Q 2 - go_fishing

If the following type of extreme event occurs, how likely is it that you go out and fish?

[1-5; from 1 – very unlikely, to 5 – very likely]

Table A.51: Interviewee: I 2 Q 2

	Event	Answer	Score	Method
a	Heatwave in the winter season	Extremely warm winter we ice fish so little, therefore it is a bit difficult to answer. (2)	2	O
b	Heatwave in the summer season	(3) Depends a little on what we are fishing	3	O
c	Severe icing (in the winter season)	1	2	G
d	Algal bloom (in the summer season)	Doesn't affect us much up here; locally there may be algal bloom in a bay. (4)	4	O
e	Extreme cloudburst (in the summer season)	3	3	O
f	Gale	1, not me at least with my small boat	1	O
g	Storm	1	1	O
h	Are there any of these in combination that affect how likely it is that you go out and fish?	Not really; it's the wind that is decisive for us	NA	NA

Q 3 - catchability

Do you experience that the catchability of the fish changes due to such extreme weather events?

[1–5; from 1 – much worse, 3 – no difference, to 5 – much better]

Table A.52: Interviewee: I 2 Q 3

	Event	Answer	Score	Method
a	Heatwave in the winter season	3	3	O
b	Heatwave in the summer season	2, Becomes worse, maybe not for all species, but they move to other areas, so you have to search elsewhere	2	O
c	Severe icing (in the winter season)	Hypothetical question, since we always have ice in winter; icing can happen in autumn, but we rarely fish then, so can't answer that	-998	NA
d	Algal bloom (in the summer season)	Hard to answer, doesn't occur very often	-998	NA
e	Extreme cloudburst (in the summer season)	3	3	O
f	Gale	It becomes harder to fish, but does not affect the actual catch; (2). Can affect a little since it's harder to fish	2	O
g	Storm	In a storm you can't fish, so catchability is zero	1	NA

Q 4 - catch_assemblage

Do you catch a different composition of species during such extreme weather events?

[1–5; from 1 – very similar, to 5 – very different species composition]

Table A.53: Interviewee: I 2 Q 4

	Event	Answer	Score	Method
a	Heatwave in the winter season	1	1	O
b	Heatwave in the summer season	Somewhat different species if we fish in the same place e.g., a lot of bream; somewhat different (4).	4	O
c	Severe icing (in the winter season)	NA	-998	NA
d	Algal bloom (in the summer season)	NA	-998	NA
e	Extreme cloudburst (in the summer season)	1	1	O
f	Gale	1	1	O
g	Storm	NA	-998	NA

Q 5 - catch_condition

Are the fish in the catch of worse condition or quality when caught during extreme weather events, compared to under normal weather conditions?

[1–5; from 1 – much worse, 3 – no difference, to 5 – much better quality]

Table A.54: Interviewee: I 2 Q 5

	Event	Answer	Score	Method
a	Heatwave in the winter season	3	3	O
b	Heatwave in the summer season	1 Yes, then it gets quite a lot worse. Perch cannot tolerate lying in nets; they die almost immediately. Salmon in traps is a short fishing period and in deep water, so it doesn't get warm enough to affect them	NA	M
c	Severe icing (in the winter season)	NA	-999	NA
d	Algal bloom (in the summer season)	If there were to be strong algal bloom, which hasn't happened so far, then it would certainly affect negatively hypothetical.	2	NA
e	Extreme cloudburst (in the summer season)	NA	-998	NA
f	Gale	NA	-998	NA

Answer	Score	Method
1	1	O

Q 17 - infrastructure

Is there infrastructure on land (e.g., landing harbors, boat ramps) that makes it possible to choose other fishing locations?

[0–2; 0 – no, requires that I am at the same place, 1 – yes, to some extent, 2 – yes, much that makes great mobility possible]

Table A.67: Interviewee: I 2 Q 17

Answer	Score Method	
We only have one landing harbor, so it requires us to stay in the local area. (0)	0	O

Q 18 - management_space

Do current management regulations make it possible to choose other fishing locations? Briefly describe what possibly limits your choice.

[0–2; 0 – no, requires that I am at the same place, 1 – yes, to some extent, 2 – yes, much that makes great mobility possible]

Table A.68: Interviewee: I 2 Q 18

Answer	Score Method	
Generally, we have quite a lot of mobility in terms of management; fixed gear locations are accessible fishing spots. Only for salmon fishing the license is tied to a specific boat, so you can't switch to a larger boat. For net fishing it doesn't matter. (Example given: switching to a larger and safer boat than the one tied to the salmon license in order to haul the salmon trap during gale, but then getting a penalty on the license).	999	NA

Q 19 - management_species

Do current management regulations make it possible to choose other target species? Briefly describe what possibly limits your choice.

[0–2; 0 – no, requires that I am at the same place, 1 – yes, to some extent, 2 – yes, much that makes great mobility possible]

Table A.69: Interviewee: I 2 Q 19

Answer	Score Method	
1 Depends on the fishing method. Salmon is the most restricted by management; it's the hardest to switch between species. Vendace (siklōja) too, because of the short season. At that time, we have no other alternative species to fish.	1	O

Q 20 - unc_15_19

How much do you think the answers to these questions (questions 15–19) vary between fishers in the group you represent?

Table A.70: Interviewee: I 2 Q 20

Answer	Score Method

[1] Not much variation. Most are very proud to be fishers; how much one fishes in practice may vary, but in terms of meaning, there are no major differences	2	G

Q 36 - fdays

Approximately how many days per year do you fish?

[free text description]

Table A.86: Interviewee: I 2 Q 36

Answer	Score - low (given)	Score - up (given)	Unit
Hard to say. If we have 6 months without ice, we actively fish 1 third of the days. But we keep the gear in the water all ice free days.	50	100	days

Q 37 - income

Approximately how large is your gross income from a fishing day on average?

[free text description]

Table A.87: Interviewee: I 2 Q 37

Answer	Score - low (given)	Score - up (given)	Unit

Impossible to calculate per day. Over 6 months? It's the four weeks of vendace fishing that make up the income. This varies. I haven't broken down exactly what the fishing itself gives, plus there's all the processing afterwards. Then you'd also have to deduct labor costs. Teija calculates roughly to get a value: 1.4 million SEK per year from vendace fishing. Plus some perch and bream. We haven't fished salmon for several seasons — the quota is fished up in 7 days [by those who have good fishing waters near the Torne River], so it's not worth setting the gear, since it takes a week to set and a week to haul.

Q 38 - season_maint

How large are the repair and maintenance costs for the fishing during one year?

[free text description]

Table A.88: Interviewee: I 2 Q 38

Answer	Score - low (given)	Score - up (given)	Unit
I don't remember, it gets lumped together with all other repairs at Guldhaven. We buy 1 boat per season several hundred thousand SEK and a new trawl, 200k SEK, other stuff 100k SEK. Roughly 0.5 million SEK over two years.	1e+05	5e+05	sek_season

Q 39 - fuel_trip

Answer	Score	Method
5	5	O

Q 45 - addition

Anything you want to add?

[free text description]

Table A.95: Interviewee: I 2 Q 45

Answer	Score	Method
The striped perch are real stripes! They have found more in test fishing. Small ones, now frozen, which she will send to us. 234 perch in the test fishing, 9 33 cm. We have a lot of perch here now, never been so many on rod fishing — in a 1 hour round we get 10 perch of eating size. Why do you think? Now that the vendace stock is so good, they have a lot of food, and they grow well when it's warm. Seems to be good recruitment too, since we caught so many small ones. We had the nets here in Långviken, along a gradient from open sea to inner bay: mostly bream in the innermost net, and mostly perch in the outermost net. The largest perch were farthest out.	- 999	NA

Q 46 - substitution_capacity

If I lose one planned fishing day, I can usually make up for it later without it affecting what I achieve overall

[1–5; from 1 – strongly disagree, to 5 – strongly agree]

Table A.96: Interviewee: I 2 Q 46

Answer	Score	Method
For the vendace fishery, a lost day can have a huge impact (could be a million in lost income), linked to the restricted quotas. For the other small-scale coastal fishery, a lost day is of almost no importance.	5	O

Q 47 - unc_46

How much do you think the answers to these questions (question 46) vary between fishers in the group you represent?

Table A.97: Interviewee: I 2 Q 47

Answer	Score	Method
You will likely get the same reply from both type of fishers	1	O

Interviewee: I 3

id3 is professional coastal fishermen in southwest bothnian sea (norrsundet). they fish with gillnets and traps. traps are only used for salmons. the main target is herring, whitefish, salmon, perch, and eel. they

also run a restaurant and have several fish trucks. the herring fishing takes place a few hundred meters from the harbor. they mention whitefish, salmon, perch in the local area, and in the gulf of gÅvle. their average distance travel is about 1 hour (assuming 10 knots it is about 20 km) and the longest distance travel is 3 hours (assuming 10 knots it is max 55 km) the main fishing season is summer (from april to august). in winter they generally do not go out until spring comes. how they adapt: id3 can adapt when fishing with nets to hw by avoiding hottest hours, performing shorter sets and using cooling boxes. can also adapt to hw, ab and gales by changing fishing location. to avoid hw and ab they can go further out, the opposite for gales. in any case they can move on short distances and can cope with gales only in shallow waters, they donâ€™t go deep and with storms they donâ€™t go out at all. their spatial mobility is mainly affected by the boat (12m boat) and infrastructure (they want to go back home) on second instance by management that makes possible to fish in proximity (over a coastline spanning of about 60 km in aerial distance). there is not the same flexibility for salmon traps, which are fixed.

Q 2 - go_fishing

If the following type of extreme event occurs, how likely is it that you go out and fish?

[1–5; from 1 – very unlikely, to 5 – very likely]

Table A.98: Interviewee: I 3 Q 2

	Event	Answer	Score	Method
a	Heatwave in the winter season	Depends on ice. Boats are usually hauled up in winter. If forecast shows winter is over, we might launch. Unlikely to put in and haul up again. Might use the small boat if open water, but ice may return. Large boats remain on land. =1 regardless.	-999	NA
b	Heatwave in the summer season	Then we fish, just go further out where it's cooler. =5.	5	O
c	Severe icing (in the winter season)	5 (icing can happen in spring).	-999	G
d	Algal bloom (in the summer season)	Rare up here, but still fish. =5.	5	O
e	Extreme cloudburst (in the summer season)	If gear is already out, we go anyway. If not, we wait. =3.	3	O
f	Gale	No, we stay home. =1.	1	O
g	Storm	No, we stay home. =1.	1	O
h	Are there any of these in combination that affect how likely it is that you go out and fish?	Wind has the greatest impact here. Wind direction matters too (this August mostly W & NW winds, cooling the water – no point fishing perch then, they just stop moving).	NA	NA

Q 3 - catchability

Do you experience that the catchability of the fish changes due to such extreme weather events?

[1–5; from 1 – much worse, 3 – no difference, to 5 – much better]

Table A.99: Interviewee: I 3 Q 3

	Event	Answer	Score	Method
a	Heatwave in the winter season	Not relevant	-999	NA
b	Heatwave in the summer season	Heatwave makes it worse. =2.	2	O
c	Severe icing (in the winter season)	not relevant	-999	NA
d	Algal bloom (in the summer season)	For perch, it gets worse (=2). Same for herring, due to warmth.	3	M
e	Extreme cloudburst (in the summer season)	Doesn't affect catchability (only whether we go out). =3.	3	O
f	Gale	Yes – after a gale from the right direction, herring can blow in, salmon may swim more too (E, NE in summer). =4. From W & NW it gets worse instead.	NA	M
g	Storm	Same, just stronger wind.	NA	NA

Same answer if you ask other fishers with a similar business	1	O

Interviewee: I 4

id4 is a resident of the archipelago in the northern proper baltic (hasselÅ¶, tjust archipelago). archipelago fisherman cannot sell their catchers. in the past, there was a very diversified fishing community with various types of nets for coastal and freshwater species. nowadays they continue to fish with nets for perch, herring, whitefish. he mentions also the importances of being able to catch fish with rods, but in the second interview he only refers to fishing with nets. fishing mostly happens during summer (april to august), winter fishing is less common but can happen. he mentions that if the water is free from ice they can cast nets also in winter. how they adapt: id4 is not economically dependent on fishing and in general tend to do it only when there are good conditions. he can adapt to hw by performing shorter (not overnight) sets. can also adapt to hw, ab and storms by changing fishing location. to avoid hw and ab they can go further out, the opposite for storms. in any case they can move on very short distances. their spatial mobility is mainly affected by its assigned fishing lot.

Q 2 - go_fishing

If the following type of extreme event occurs, how likely is it that you go out and fish?

[1–5; from 1 – very unlikely, to 5 – very likely]

Table A.145: Interviewee: I 4 Q 2

	Event	Answer	Score	Method
a	Heatwave in the winter season	Quite likely, if the water is open we'll go out, 4	4	O
b	Heatwave in the summer season	2. Depends on how it affects winds and algal blooms; this year we had huge problems with algal blooms (1 month).	2	O
c	Severe icing (in the winter season)	No problem for us, too far south.	-999	NA
d	Algal bloom (in the summer season)	1	1	O
e	Extreme cloudburst (in the summer season)	We can get to the boathouse, but from there out onto the lake it's more difficult; 1, if we don't have gear in the water. But we check the weather forecast very carefully before putting in the gear.	1	O
f	Gale	1	1	O
g	Storm	1	1	O
h	Are there any of these in combination that affect how likely it is that you go out and fish?	Strong winds and high water levels.	NA	NA

Q 3 - catchability

Do you experience that the catchability of the fish changes due to such extreme weather events?

[1–5; from 1 – much worse, 3 – no difference, to 5 – much better]

Table A.146: Interviewee: I 4 Q 3

	Event	Answer	Score	Method
a	Heatwave in the winter season	NA	2	NA
b	Heatwave in the summer season	Yes, in the past when perch existed, they liked warmth, but now there are no perch, so the effect is not so big on the species we fish for	3	NA
c	Severe icing (in the winter season)	NA	-999	NA

d	Algal bloom (in the summer season)	It's devastating, depressing to live around this algal soup, grandchildren can't swim, it's an imbalance in the Baltic Sea ecosystem, a sad new phenomenon. We try to deal with it when it drifts ashore. It becomes a white coating on the bottom when it sinks. We're worried about algal toxins (cows can break them down somewhat, but single-stomached animals can't; affects the liver). 1.	1	O
e	Extreme cloudburst (in the summer season)	No, 3	3	O
f	Gale	A little worried about strong winds since we don't have big boats.	2	NA
g	Storm	Same with storms.	2	NA

[1–5; from 1 – not important at all, to 5 – very important]

Table A.171: Interviewee: I 4 Q 27

Answer	Score	Method
5. We’ve lost local competence when people die and take knowledge with them (e.g., neighbor who knew when/where to catch turbot, burbot).	5	O

Q 28 - benefit_local_community

How much does your local community benefit from your fishing

[1–5; from 1 – not important at all, to 5 – very important]

Table A.172: Interviewee: I 4 Q 28

Answer	Score	Method
I can’t sell/deliver fish, only the professional fisher can. More cultural—nice to have fish on the table. =1.	1	O

Q 29 - benefit_personal_community

How much does your “community” benefit from your fishing? Explain!

[1–5; from 1 – not important at all, to 5 – very important]

Table A.173: Interviewee: I 4 Q 29

Answer	Score	Method
--------	-------	--------

Hard to judge. There have been big changes recently – many have passed away or disappeared, and some younger people have moved in who have the opportunity to fish but haven't started yet, they're still renovating. At our fishing meetings people do show up – they're not uninterested. People are interested in fishing, but to what extent they actually fish or communicate about it varies. It creates a unifying factor among us subsistence fishers who belong to the village association. Those who own a joint property with fishing rights and waters – and then there are the summer guests, but I have no idea about them.

Answer	Score	Method
Other subsistence fishermen will surely answer the same.	1	O

Interviewee: I 5

id5 represents the organization sportfiskarna, which is active in all sweden. he is based in stockholm. the members of sportfiskarna are anglers that mostly fish for pike, perch and zander. additionally, fishing for sea trout and trolling for salmon is common. they fish in lakes, streams and coastal areas. they can use boats in coastal areas and lakes, or just fish from the shore. in winter they also do ice fishing on lakes and generally they do not use boats until the ice is completely gone. the members practice both catch-and-release and keeping the catch. recreational fisherman can move around different fishing spots. how they adapt: sportfisherman are diverse but have in common to fish exclusively for fun. they tend to fish only when it is a pleasant experience. they can cope to some extent with extreme events by adapting their location if they want to fish on the coast (going deeper or finding sheltered places) or move to lakes. their spatial mobility has virtually no limits.

Q 2 - go_fishing

If the following type of extreme event occurs, how likely is it that you go out and fish?
[1-5; from 1 – very unlikely, to 5 – very likely]

Table A.192: Interviewee: I 5 Q 2

Event	Answer	Score	Method
-------	--------	-------	--------

a	Heatwave in the winter season	If it's otherwise a good winter, then it's just nice weather. But if it's a mild winter, then you can't go out. Is ice fishing the dominant form? Few go out in boats? On the big lakes. and at Simrishamn there is some trolling from boats. If we think about ice fishing? Absolutely, =1 if the ice isn't there or is dangerous to walk on.	1	O
b	Heatwave in the summer season	Yes, but in another way. When it's hot, fishing in running waters (salmon, trout, grayling) is closed. Perch and zander fishing only gets better in warm weather. Few target pike in a heatwave. But if you booked a salmon-fishing week, it simply gets canceled. Zander & perch = 5; salmon & trout = 1; pike = 2 (or 1, discussed with another angler present). But "vacation fishers" will probably go out regardless. Pike fishing is usually in spring & autumn; high temps affect survival.	NA	M
c	Severe icing (in the winter season)	Big impact.	1	NA
d	Algal bloom (in the summer season)	Less attractive, but still possible to fish; =2.	2	O
e	Extreme cloudburst (in the summer season)	People hold back; it's a comfort factor. Most stay indoors	2	NA
f	Gale	Yes, people hold back; most stay home, except the really keen ones who may go out in sheltered spots	2	NA
g	Storm	No, impossible to fish.	1	NA
h	Are there any of these in combination that affect how likely it is that you go out and fish?	Combination of gale/storm and heavy rain – Even more unpleasant, a negative synergy effect	NA	NA

Multiple options identified

e	Extreme cloudburst (in the summer season)	no	3	NA
f	Gale	no	3	NA

g	Storm	no	3	NA
---	-------	----	---	----

Q 6 - cope_condition

If the condition/quality of the fish in the catch is negatively affected, how likely is it that you can do something about it? Explain what!

[1–5; from 1 – very unlikely, to 5 – very likely]

Table A.198: Interviewee: I 5 Q 6

	Event	Answer	Score	Method
a	Heatwave in the winter season	NA	-999	NA
b	Heatwave in the summer season	No, nothing can be done. If fish are in poor condition, there's nothing you can do. Doesn't really apply to sport fishing since fish aren't trapped in gear	1	NA
c	Severe icing (in the winter season)	NA	-999	NA
d	Algal bloom (in the summer season)	NA	-999	NA
e	Extreme cloudburst (in the summer season)	NA	-999	NA
f	Gale	NA	-999	NA
g	Storm	NA	-999	NA

Q 7 - lag_effect

Do this extreme weather events have long-term effects on how you fish or catch composition

Greatest effect is probably on Arctic char (though not a major sportfishing species). Other species may move in: grayling, trout, whitefish, perch & pike. Biggest sportfishing impact from extreme weather is likely on char. On the coast, fish can always go deeper. Does it affect how you fish? Yes – e.g., trout anglers (spring & autumn from shore) may need to fish deeper or at different times. On Gotland, sea trout fishing is big – if warming lasts longer, the season gets shorter until it cools again.

Table A.199: Interviewee: I 5 Q 7

Answer	Score - low (given)	Score - up (given)	Unit
Yes – e.g., if you booked a salmon fishing week and they close fishing, you're stuck with costs for a cabin if it can't be rebooked. Usually you can rebook, but I don't know the cost.	NA	NA	not_reported

Q 44 - unc_36_42

How much do you think the answers to these questions (questions 36–43) vary between fishers in the group you represent?

Table A.237: Interviewee: I 5 Q 44

Answer	Score	Method
5	5	O

Q 45 - addition

Anything you want to add?

[free text description]

Table A.238: Interviewee: I 5 Q 45

Answer	Score	Method
I think you've captured most of it. The most likely major impacts are wind – if extreme weather is prolonged, it affects access. And if you fish salmonids, a summer heatwave affects both fish and fishing opportunities. Same with winter ice fishing.	- 999	NA

Q 46 - substitution_capacity

If I lose one planned fishing day, I can usually make up for it later without it affecting what I achieve overall
[1–5; from 1 – strongly disagree, to 5 – strongly agree]

Table A.239: Interviewee: I 5 Q 46

Answer	Score	Method
One fishing day might get lost, but you might be able to recover it later in the season	3	O

Q 47 - unc_46

How much do you think the answers to these questions (question 46) vary between fishers in the group you represent?

Table A.240: Interviewee: I 5 Q 47

Answer	Score	Method
--------	-------	--------

It might vary a lot among fishers. If you have booked a guide or an arrangement, a lost day might be difficult to recover. If you just go out fishing in your "home waters" it might be less of a loss. So substantial variation across fishers.

Interviewee: I 6

id6 fish pelagic fish both in the baltic sea and the north sea. in the baltic sea, the fishing targets herring/sprat and sharp-sprat, and the catch is sent to fishmeal. in the baltic sea, lars-uno fishes from the southern baltic up to the bothnian sea (at the level of sundsvall). they can occasionally fish in outermost regions (shetlands). the main fishing season is from august to april (but the season can extend longer into spring and summer), and the current law does not establish any limitation regarding time at sea (e.g.: seasonal ban, weekend ban). their activity is limited by the quota. in winter their activity in the baltic might be affected by ice coverage. how they adapt: pelagic trawlers have a great spatial mobility because of their large size vessels. their primary method to adapt to weather is to move around: they may switch from an area to another when they know the climatic conditions (i.e.: water temperature) are good. in the case of local weather is not good they stay in port. they have efficient cooling systems to deal with hot weather.

Q 2 - go_fishing

If the following type of extreme event occurs, how likely is it that you go out and fish?

[1–5; from 1 – very unlikely, to 5 – very likely]

Table A.241: Interviewee: I 6 Q 2

	Event	Answer	Score	Method
a	Heatwave in the winter season	5	5	O
b	Heatwave in the summer season	1; wait a minute, spring when the weather changes; in July when it's hottest, the fish are scattered, so there's no point in going out; say 2.	1.5	G
c	Severe icing (in the winter season)	we avoid going out, 1.	1	O
d	Algal bloom (in the summer season)	5	5	O
e	Extreme cloudburst (in the summer season)	5	5	O
f	Gale	4 in the Baltic Sea at least; if we are going to consume the fish in the North Sea, then we wait because the fish can spoil , but in the Baltic Sea we don't fish for human consumption	NA	M
g	Storm	1, we have the quota so we don't need to risk the crew.	1	O

h	Are there any of these in combination that affect how likely it is that you go out and fish?	Icing & high winds, then it's 1	NA	NA

Q 36 - fdays

Approximately how many days per year do you fish?

[free text description]

Table A.277: Interviewee: I 6 Q 36

Answer	Score - low (given)	Score - up (given)	Unit
In the Baltic Sea, from November to June, about half a year, 7 months, at the moment, but that can change; we fish about 80% of those days, are on board and have the trawl in and are fishing	140	170	days

Q 37 - income

Approximately how large is your gross income from a fishing day on average?

[free text description]

Table A.278: Interviewee: I 6 Q 37

Answer	Score - low (given)	Score - up (given)	Unit
It varies; if we're talking about all boats, we collaborate with another boat, and we've exchanged some fish between us; in the Bothnian Sea, [calculating] 11,000/hour, 25,000 per day in the Bothnian Sea; but off Shetland, we caught 400 tons of mackerel, the entire annual quota, in one hour! That was 8 million/hour	25	30	Million_sek_season

Q 38 - season_maint

How large are the repair and maintenance costs for the fishing during one year?

[free text description]

Table A.279: Interviewee: I 6 Q 38

Answer	Score - low (given)	Score - up (given)	Unit

We are doing extensive renovations now, because we are doing a 10-year class when we go through the entire boat, so it could be 10% of the catch, in a normal year it is 1% of the catch (has an income of SEK 25-30 million per year), so 1% of that. If there are two trawls in a season, SEK 300-400. We have an extra trawl with us, as we have two drums, and we have 1-2 trawls in Norrsundet	1	10	% of income
---	---	----	-------------

Q 39 - fuel_trip

How large are the fuel costs (or fuel consumption) for a fishing trip on average?

[free text description]

Table A.280: Interviewee: I 6 Q 39

Answer	Score - low (given)	Score - up (given)	Unit
if a fishing trip lasts about 1 week; in the Bothnian Sea; 50 m3/day * 6 days* = 240 kkr/week 2.5 tons * 4.5*22 hours; runs 22 hours per day 5000L*8h/day; for one week 240 kkr/week (in the Bothnian Sea) [talks about mackerel fishing]	600	650	liters_hour

Q 40 - extra_fuel

What are the costs for extra fuel to travel further than normal?

[free text description]

Table A.281: Interviewee: I 6 Q 40

Answer	Score - low (given)	Score - up (given)	Unit
transport by truck to Skagen from Norrsundet; do not want to drive the boat that far, it costs money; the Bothnian Sea to the Baltic Sea takes 1.5 days	NA	NA	not_reported

Q 41 - extra_crew

What are the costs for extra crew on board?

[free text description]

Table A.282: Interviewee: I 6 Q 41

Answer	Score - low (given)	Score - up (given)	Unit
Occasionally, if someone is injured or unavailable; there are four of us on the boat; previously, when we had the net, we needed nine people, but that was ten years ago; substitutes receive the same pay	NA	NA	not_reported

Q 42 - extra_cleaning_cost

What are the costs for gear cleaning (in case of unusual fouling, e.g., due to algal bloom)?

[free text description]

Table A.283: Interviewee: I 6 Q 42

Answer	Score - low (given)	Score - up (given)	Unit
No, we don't need to clean the trawls; we lower them into the sea upside down so that they get clean; we both hose them down and dip them; no difference with algae blooms.	0	0	hours

Q 43 - exytra_other

Are there any other extra costs that may arise during extreme weather events, and how large are they then?

[free text description]

Table A.284: Interviewee: I 6 Q 43

Answer	Score - low (given)	Score - up (given)	Unit
Yes, a window can break if you hit a big wave. One boat had a compass on the roof that broke and made a hole right through the roof, so it can cause damage and break things. If water gets into the boat and damages the electronics, it becomes more expensive. 10,000 for a window	NA	NA	not_reported

Q 44 - unc_36_42

How much do you think the answers to these questions (questions 36–43) vary between fishers in the group you represent?

Table A.285: Interviewee: I 6 Q 44

Answer	Score	Method
It varies a lot, many have a very new boat, so the costs are very low, and if you have a larger boat, it can withstand extreme weather better. Astrid loads > 2000 tons, while we load 500 tons, and we have to make 4 trips back and forth, while they only make 1 trip, so they probably have lower fuel costs per fish, even though they consume more when they drive	5	NA

Same answer if you ask other pelagic fishers	1	O

Interviewee: I 7

id7 is a professional coastal fisherman in the southwestern bothnian sea (Älvsgrund area?). they fish with gillnets and traps. the main fishing season is summer. they can do some ice fishing. the main target is herring, whitefish, salmon, perch. they have more salmon traps than the average coastal fisherman. fishing for perch (nets) is done from a small boat close to home, while fishing for herring happens with a larger boat more far away. a trip for herring can cost up to 100 litres of diesel (approximately 10 l*hour at 10 knots means that they can go to cast at least 50-60 km from home). how they adapt: they primarily adapt when fishing with nets to hw by changing fishing target. when it's hot they aim for perch and not for herring. in addition, they can perform shorter sets and use cooling boxes. can also adapt to hw and storms by changing fishing location. they are not affected by ab. to avoid hw they can go further out in deeper waters, the opposite for storms. in any case they can move on short distances. their spatial mobility is mainly affected by the boat and infrastructure (they want to go back home) on second instance by management that makes possible to fish in proximity. there is not the same flexibility for salmon traps, which are fixed.

Q 2 - go_fishing

If the following type of extreme event occurs, how likely is it that you go out and fish?

[1-5; from 1 – very unlikely, to 5 – very likely]

Table A.289: Interviewee: I 7 Q 2

	Event	Answer	Score	Method
a	Heatwave in the winter season	I probably go fishing anyway, it's the wind that matters, I probably try anyway (=5? or =4?)	4.5	O
b	Heatwave in the summer season	I don't go because the fish won't keep as well, I don't fish for herring at all, in that case I fish for perch, 2	2	O
c	Severe icing (in the winter season)	I am not on the lake at that time of year when there is a risk of icing (because the ice forms so early	-999	NA
d	Algal bloom (in the summer season)	I have not experienced it, but it probably has an impact, so then I don't fish	-998	NA
e	Extreme cloudburst (in the summer season)	then I fish anyway	4	NA
f	Gale	depends on the wind direction, if it's N then it's from the outside so then it's difficult, if it's S or SW, in gale force winds I don't fish anyway because there's a strong current in the lake so you get crap in your nets, but I do go out in gale force winds sometimes , depends on the wind direction	3	NA
g	Storm	1	1	O
h	Are there any of these in combination that affect how likely it is that you go out and fish?	storms and weather like that	NA	NA
