DAG revision

This is documentation on the decisions taken to draw links between events and outcomes.

We inspect the responses per event on each single potential response. We decide which to retain

go_out

Very mixed feeling about go out. This should be linked to each event

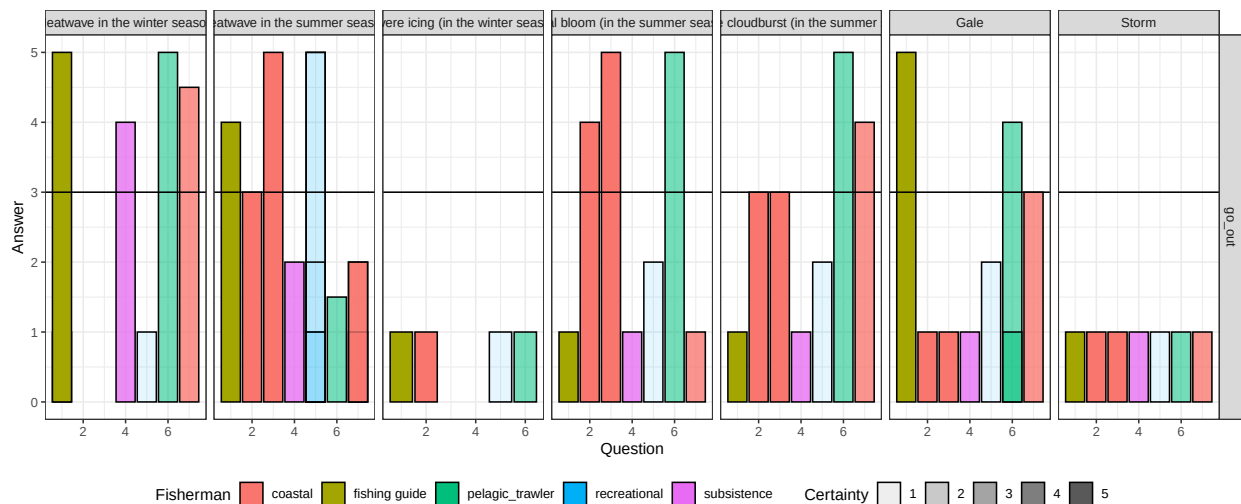

Figure 1: Distribution of answers to the question: go_out

Catchability

Catchability is associated with all the events except for cloudburst. Note: winter heatwave change for fishing guide is associated with rod fishing

catch_condition

For condition we ignore winter heatwave, because that is the effect of storminess. We keep storms and gales because it makes sense (keeping the catch onboard in a storm may cause the fish to get bad). We also exclude algal blooms because it matters only for two people, and one says that it is only hypothetical.

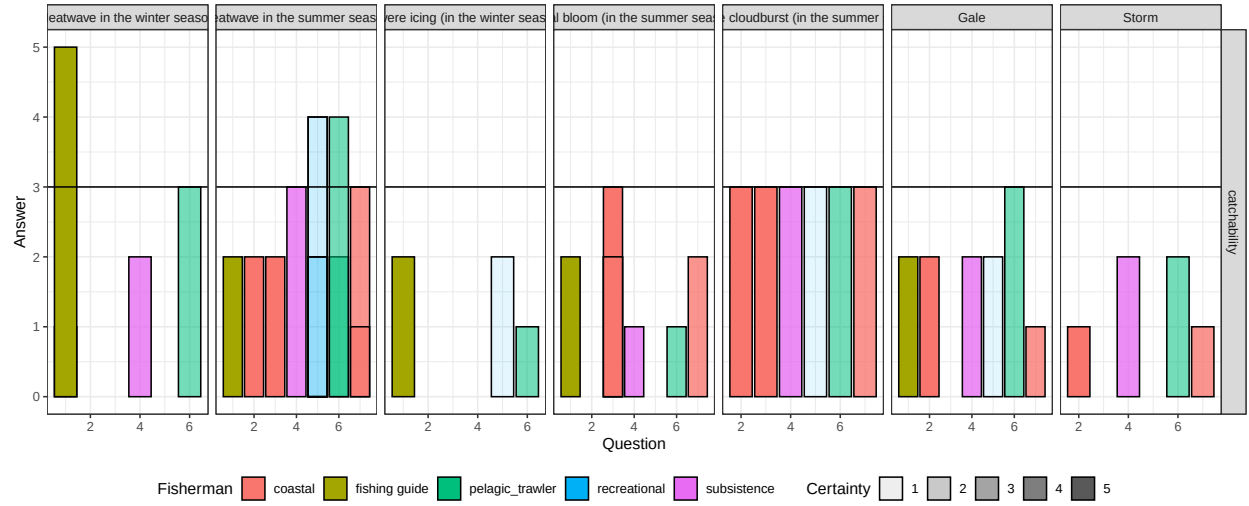

Figure 2: Distribution of answers to the question: catchability

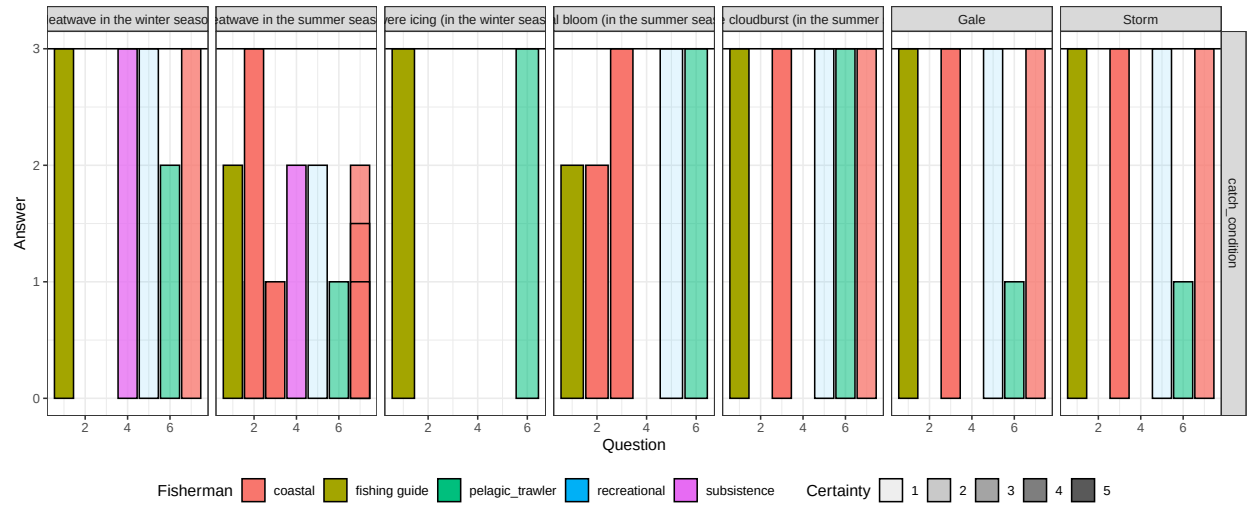

Figure 3: Distribution of answers to the question: catch_condition

personal_safety

Personal safety NOT apply to algal bloom and to summer heatwaves. Winter heatwaves is associated with ice fishing. The mention that pelagic trawler do is not correct (considers an interaction with storms)

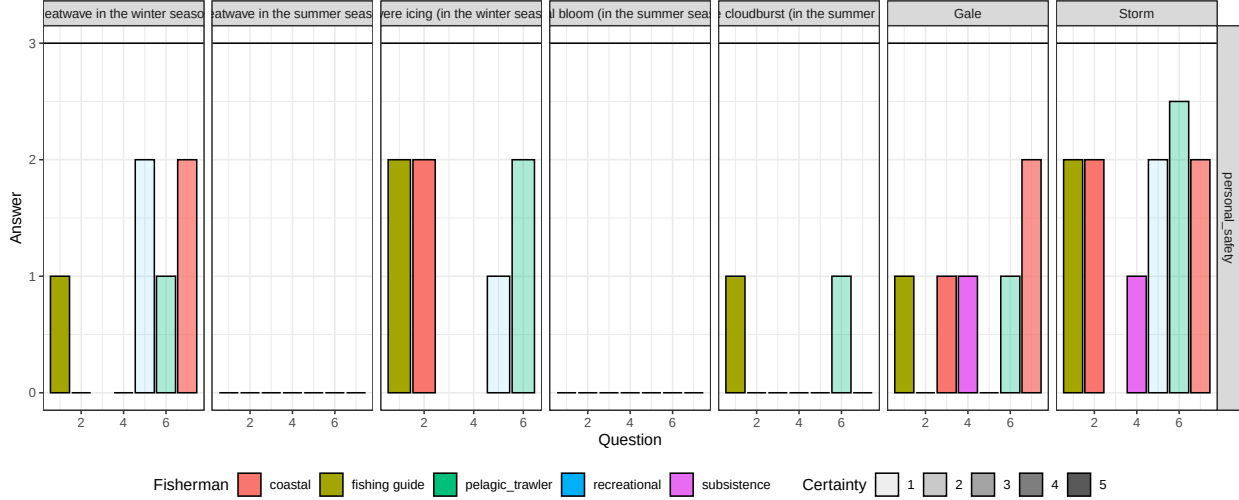

Figure 4: Distribution of answers to the question: personal_safety

damage

The gear damage that pelagic trawler mention for winter heatwave depend on the storminess, not on the heat itself. For heatwave, int N 2 mention extra work to clean, not real damages. Same for algal bloom and int 6. At this stage we are not considering “extra work/maintenance” as part of the damages. Why: only a few mention this here. Some other mention this in extra or here and there. Revise it.

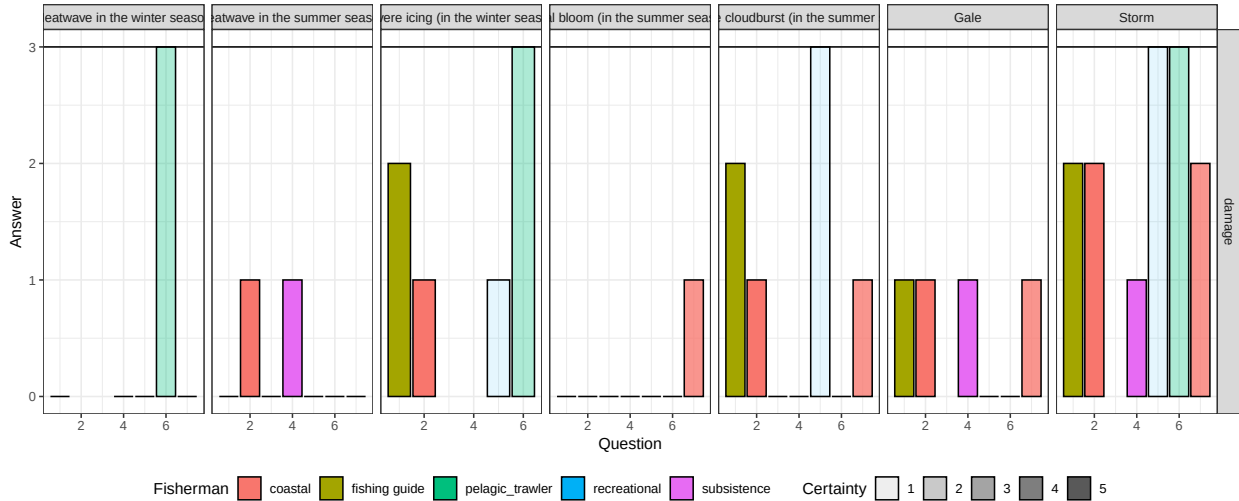

Figure 5: Distribution of answers to the question: damage

avoidance

For each event there is at least somebody that say he can avoid it. This typically imply change fishong location, sometime /especially recreational) to change gear.

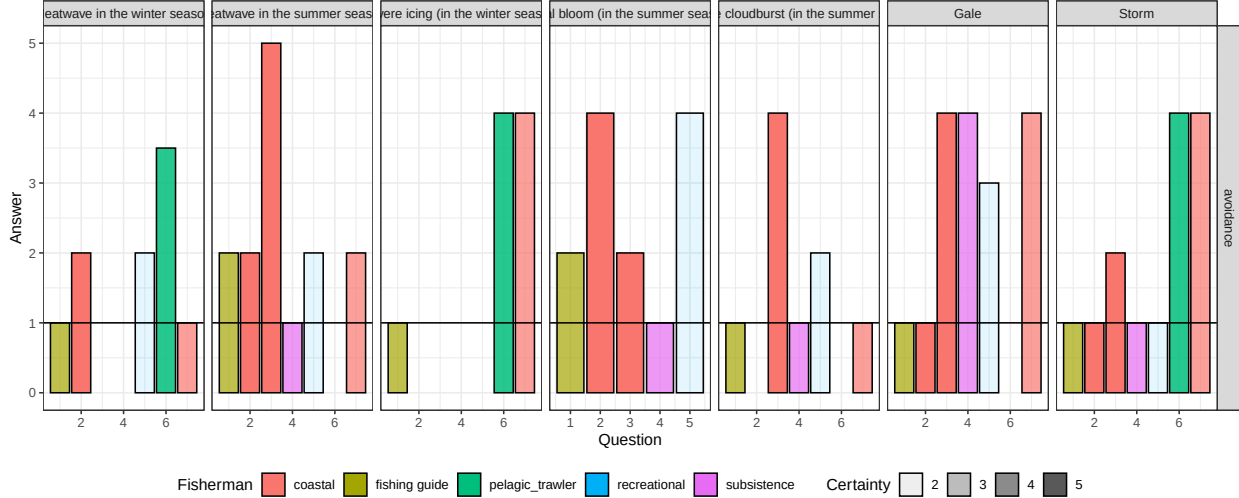

Figure 6: Distribution of answers to the question: avoidance. Answ: 1 is very difficult, 5 is easy.

cope condition

For cope condition we do not want to consider those answers that says “go fishing elsewhere”. Because we account for this in another manner. We only keep the link with summer heatwave because it contains things such as ice machines, short hauls etc. So we revise the network and make the

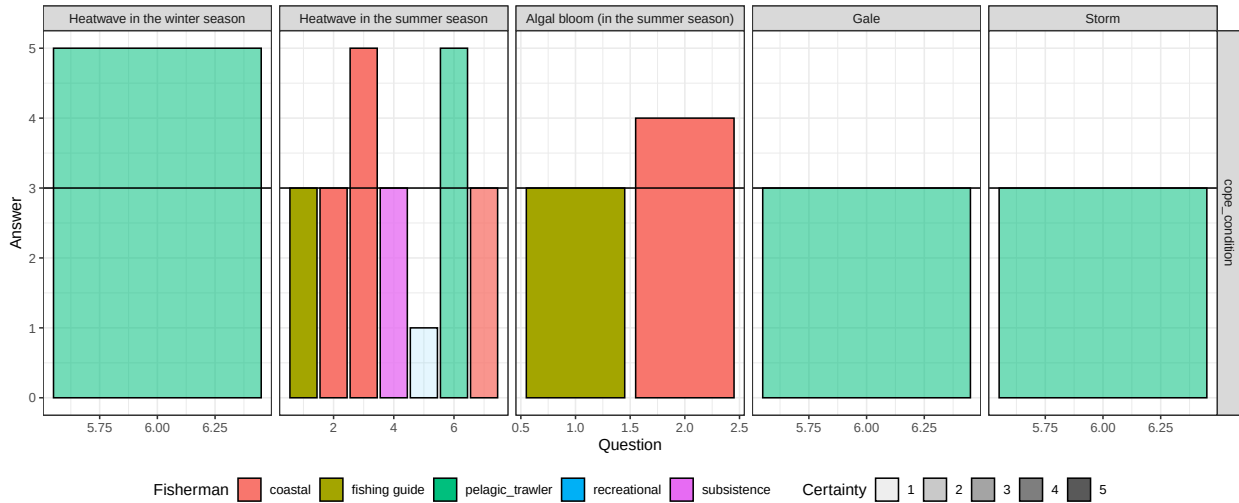

Figure 7: Distribution of answers to the question: cope_condition

pending decisions

- is extra work part of the damages?
