style	description	desc	text
fishing guide	If the following type of extreme event occurs, how likely is it that you go out and fish?	Are there any of these in combination that affect how likely it is that you go out and fish?	A lot is about safety, combinations become dangerous, e.g., strong icing and strong winds, I avoid this as much as possible; would also get fewer requests, since fishing should be enjoyable
fishing guide	How much damage can the extreme weather event cause to your gear and boat? Explain! several answers are possible]	Extreme cloudburst (in the summer season)	don't know, more if the boat sinks; is that a 3 then, don't know, depends on how big the damage is; in combination with storm then it becomes 3. Usually, you get away from a cloudburst. There is a risk; maybe 2
coastal	If the following type of extreme event occurs, how likely is it that you go out and fish?	Are there any of these in combination that affect how likely it is that you go out and fish?	Not really; it's the wind that is decisive for us
coastal	If the following type of extreme event occurs, how likely is it that you go out and fish?	Are there any of these in combination that affect how likely it is that you go out and fish?	Wind has the greatest impact here. Wind direction matters too (this August mostly W & NW winds, cooling the water – no point fishing perch then, they just stop moving).
subsistence	If the following type of extreme event occurs, how likely is it that you go out and fish?	Are there any of these in combination that affect how likely it is that you go out and fish?	Strong winds and high water levels.
recreational	If the following type of extreme event occurs, how likely is it that you go out and fish?	Are there any of these in combination that affect how likely it is that you go out and fish?	Combination of gale/storm and heavy rain – Even more unpleasant, a negative synergy effect

pelagic_trawle	If the following type of extreme event occurs, how likely is it that you go out and fish?	Are there any of these in combination that affect how likely it is that you go out and fish?	Icing & high winds, then it's 1
pelagic_trawle	How much concern for your personal safety do these extreme weather events bring?	Heatwave in the winter season	1 if the heat causes high winds
pelagic_trawle	How much damage can the extreme weather event cause to your gear and boat? Explain! several answers are possible]	Heatwave in the winter season	3, [heat wave in winter, often accompanied by storms]
coastal	If the following type of extreme event occurs, how likely is it that you go out and fish?	Are there any of these in combination that affect how likely it is that you go out and fish?	storms and weather like that

Probabilities

I2: (storm mostly damage) to gear. It very rarely happens that we lose gear completely, but a small risk exists

I3: Wind direction matters too (this August mostly W & NW winds, cooling the water – no point fishing perch then, they just stop moving)

I3: storm and gale Could damage or destroy gear/boat, or cause minor damage

I6: Heatwave in the winter season: It can go both better and worse, but it has an impact; for the same weather phenomenon, it can be both better and worse; weather changes affect catchability, as do moon phases and the time of year.

I7: Gale: depends on the wind direction, if it's N then it's from the outside so then it's difficult, if it's S or SW, in gale force winds I don't fish anyway because there's a strong current in the lake so you get crap in your nets, but I do go out in gale force winds sometimes, depends on the wind direction

Lags

I1; cloudburst: fish react to pressure changes; if there is low pressure during a downpour, then they stop biting, but if it rises after the downpour then it can be good.

I3 (gale): after a gale from the right direction, herring can blow in, salmon may swim more too (E, NE in summer). =4. From W & NW it gets worse instead

I5: the coast with prolonged winds you can get upwelling; perch may move closer inshore, and trout & whitefish may appear shallower than normal

I5: sea trout fishing is big – if warming lasts longer, the season gets shorter until it cools again

I4: Other factor is wind direction, NW is bad, then the fish disappear. Big impact. This spring it locked in at N & NW with near gale winds for several weeks

I6: force, and waits 1-2 days until it calms down; when the waves are too high, the trawl does not fish as well
